Reviewer D:

The paper is well written and focusing on an important topic affecting millions per year globally.

However, as I know, appendicitis is a clinical diagnosis that depends mainly on ultrasound. I never read any word about the role of ultrasound in appendicitis diagnosis.

I suggest that the author should add few lines about the role of ultrasound in diagnosis.

I greatly appreciate and respect the huge effort done in results analysis and statistics.

I greatly enjoyed reading the analysis which is very robust, and informative.

Just one thing I need know more about which is ANOVA. I don't think it is very essential in this work. Please explain or delete.

Answer: Thank you for the encouraging comments. We have now deleted the ANOVA as suggested and added few lines about ultrasound.

Reviewer F:

The aim of this study is to demonstrate that mast cell count and granulations are significantly different in complicated and uncomplicated cases of appendicitis. But as these tests can only be done after surgery, they cannot be used as predictors of severity. Therefore, it is recommended to change the title of this paper.

Table (1): Please adjust the writing of grades of appendicitis.

Answer: Thank you for the comments. We have now revised the title and the grade of appendicitis as well.
